

Forklift Fork Positioner

Forklift Fork Positioners - A fork positioner is actually an apparatus made out of high quality materials meant to endure the most demanding procedures and work environments. This piece of equipment enables the individual driving to work the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the arms or the entire load in order to facilitate more precise lifting and placement in a quicker and more efficient method.

The blade pocket is rather unique and enables the person operating it to be able to safely swing the blades into position without any worry of destroying the positioning cylinders. This could allow the driver the choice to perform simultaneous or independent fork movement, depending on the job requirement. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into blade positioners on existing units.
